

TransactionExchange

TransactionExchange.com – A quick overview.

EDI has helped thousands of businesses improve the efficiency with which they interact with their vendors and customers (trading partners). As a result, the costs of handling individual business transactions have reduced significantly.

However, EDI infrastructure does not come cheap. It often costs over \$200,000 to be up-and-running with EDI. Moreover, this infrastructure requires specialized maintenance and upkeep – thereby increasing the total-cost-of-ownership. All of these factors resulted in EDI being restricted to only large companies doing business with other large companies. There are 2 major consequences of this:

- a. Small and Medium sized businesses did not find EDI viable and so were left out.
- b. Large companies that already made EDI investments could not expand that investment to cover small and medium sized trading partners – thus limiting their ROI.

Until now!

TransactionExchange.com challenges this status quo by offering a radically different model. TransactionExchange.com is a hosted B2B service that makes it viable for any organization of any size in any industry to become EDI capable. Being a hosted service, it relieves you from having to make EDI investments. It supports multiple protocols (X.12, CXML, PeopleSoft XML and HTML) so any organization can do business with any other organization using any protocol.

Customer

Suppliers

Its pay-per-use fee structure removes any minimum-usage-thresholds. It's a bit like having the entire logistical infrastructure of the USPS at your disposal for the cost of a postage-stamp.
